

Chapter 14

STAGE 4: HYPOTHESIS TESTING

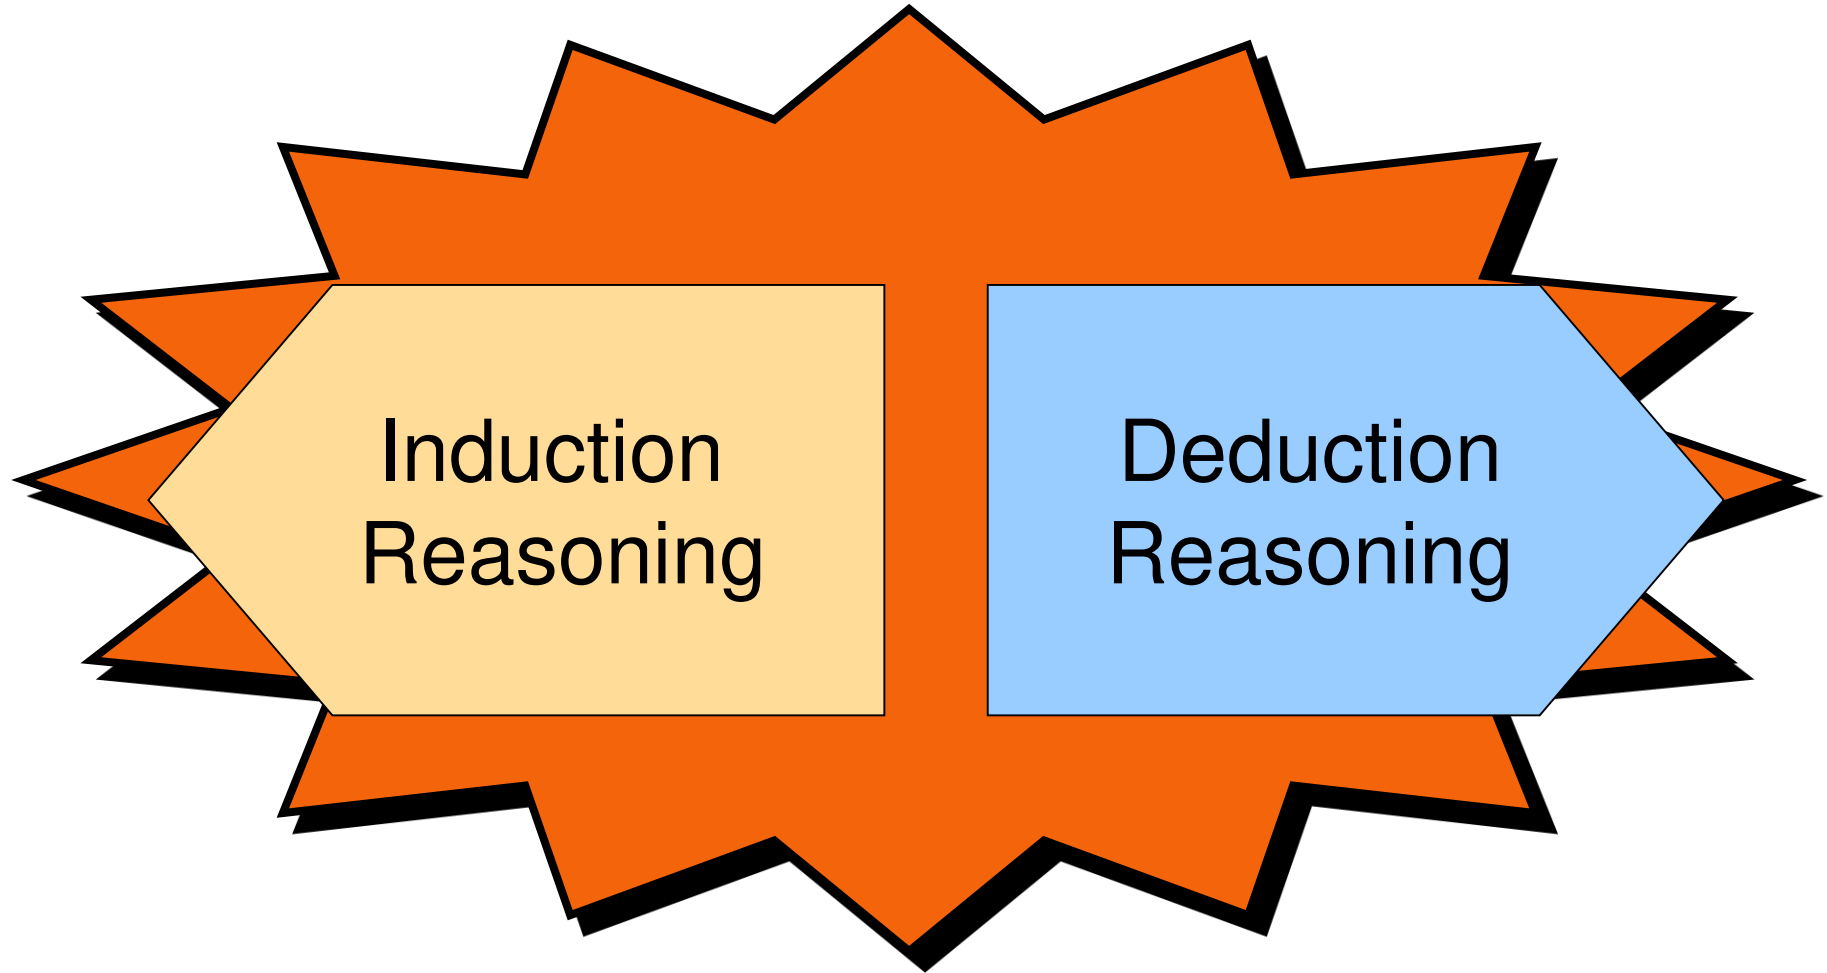

Learning Objectives

Understand . . .

- The nature and logic of hypothesis testing.
- A statistically significant difference
- The six-step hypothesis testing procedure.
- The differences between parametric and nonparametric tests and when to use each.
- The factors that influence the selection of an appropriate test of statistical significance.
- How to interpret the various test statistics.

Hypothesis Testing

Reasoning and Hypotheses

Inductions are an inferential leap from the evidence presented.

=

Reasoning and Hypotheses

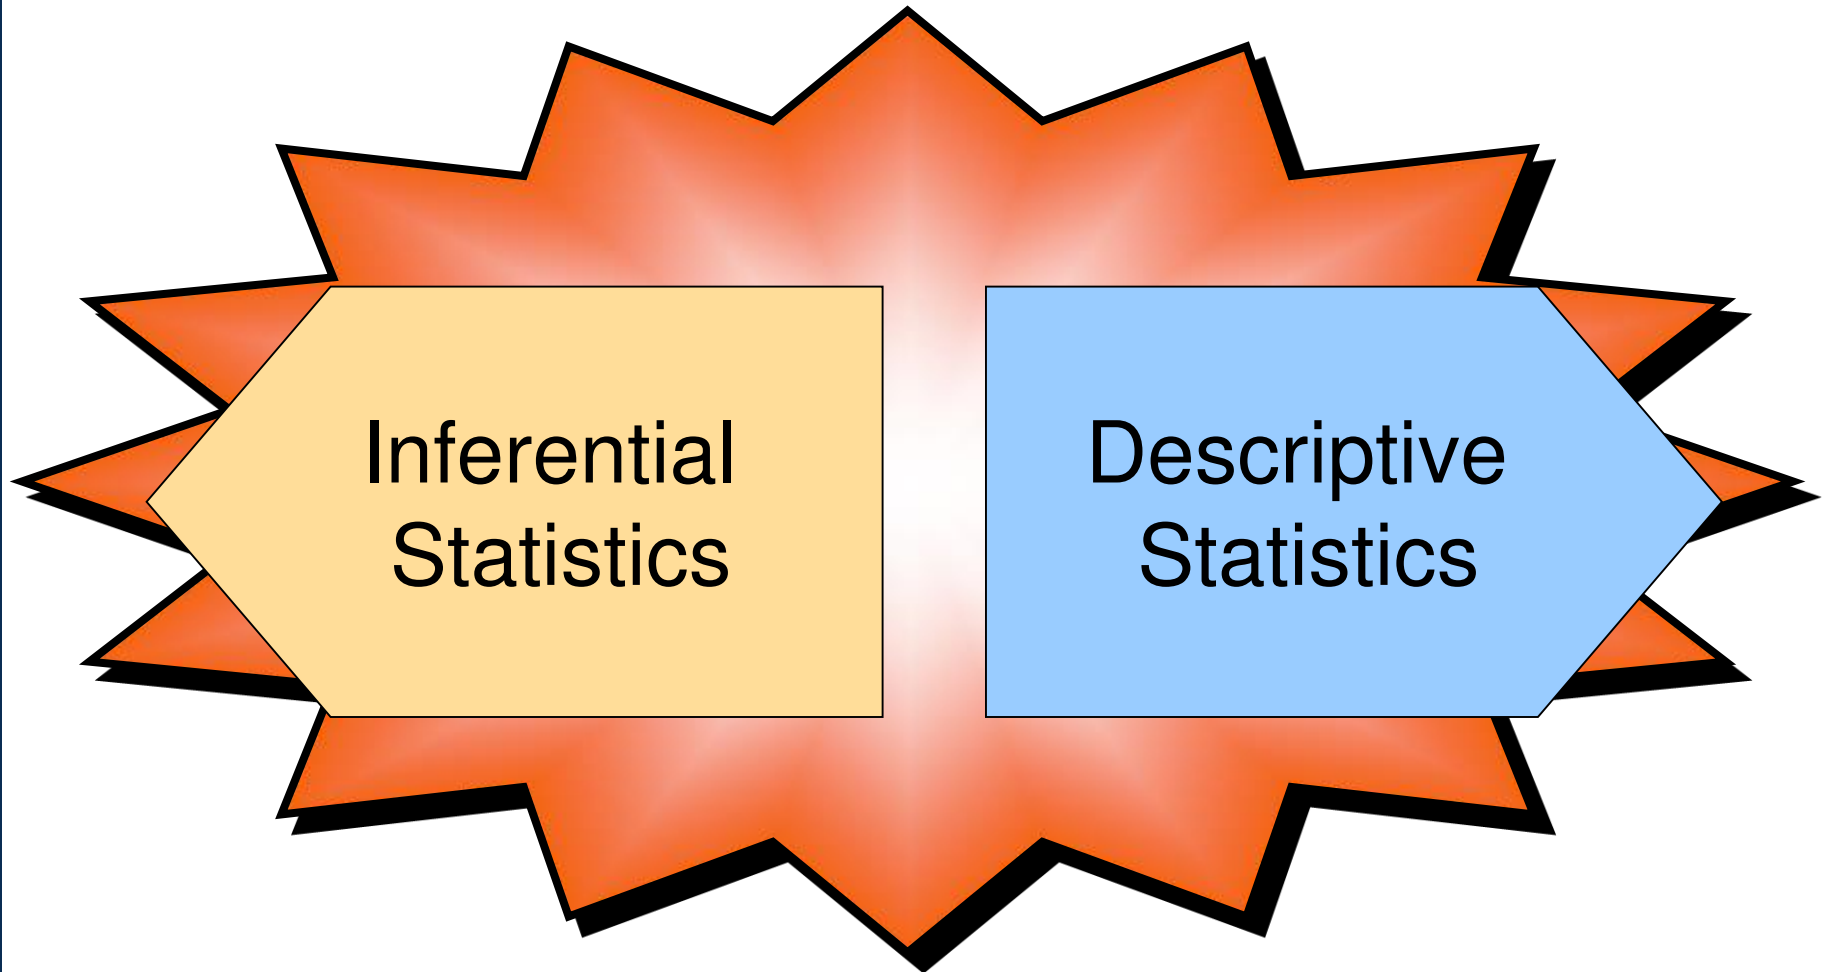

Deductions are only as good as the premises on which they are based.

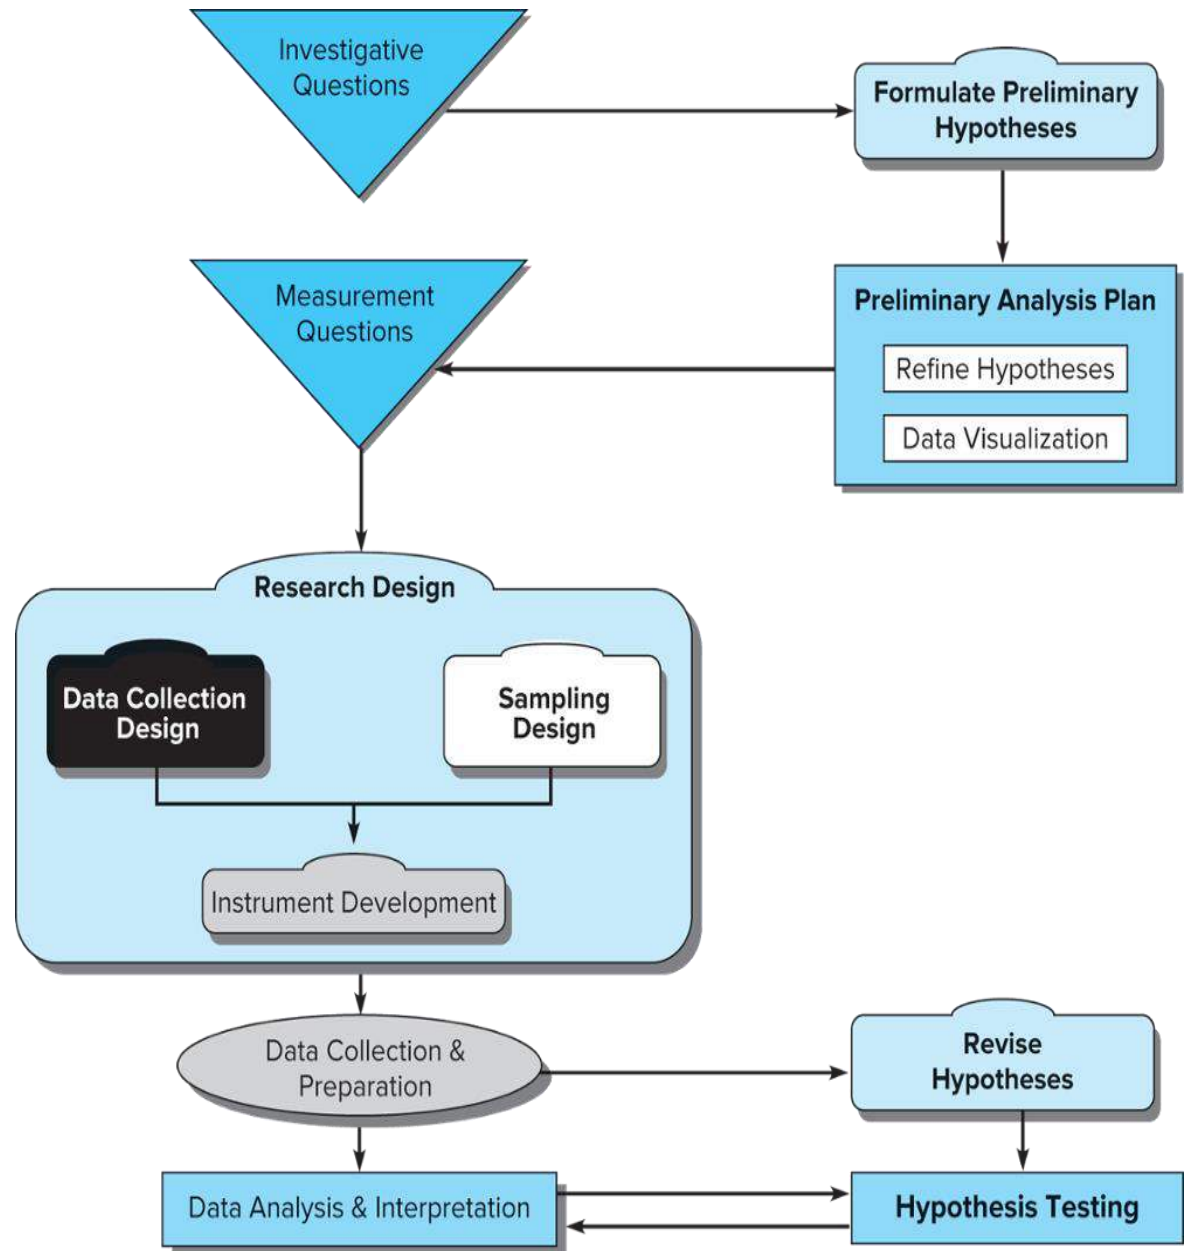

≠

Statistical Procedures

Hypothesis Testing and the Research Process

The “Ah-Ha” Moment

When researchers sift through the chaos and find what matters.

Approaches to Hypothesis Testing

Classical statistics

- Objective view of probability
- Established hypothesis is rejected or fails to be rejected
- Analysis based on sample data

Bayesian statistics

- Extension of classical approach
- Analysis based on sample data
- Also considers established subjective probability estimates

Significance & Hypotheses

Statistical Significance

Practical Significance

Null vs. Alternative Hypotheses

Null

- $H_0: \mu = 60 \text{ mpg}$
- $H_0: \mu \leq 60 \text{ mpg}$
- $H_0: \mu \geq 60 \text{ mpg}$

Alternative

- $H_A: \mu \neq 60 \text{ mpg}$
- $H_A: \mu > 60 \text{ mpg}$
- $H_A: \mu < 60 \text{ mpg}$

Two-Tailed Test of Significance

One-Tailed Test of Significance

Decision Rule

*Take no corrective action if the analysis shows that one **cannot reject** the null hypothesis.*

Statistical Decisions

		State of Nature	
		H_0 is true	H_A is true
Decision: Accept	H_0	Correct decision Power of test Probability = $1 - \alpha$	Type II error Power of test Probability = β
	H_A	Type I error Significance level Probability = α	Correct decision Power of test Probability = $1 - \beta$

Innocent of crime Found not guilty	Guilty of crime Unjustly acquitted
Innocent Unjustly convicted	Guilty Justly convicted

Probability of Making a Type I Error

A

Critical Values

$Z = 1.96$ (significance level = .05)

\bar{X}_c = the critical value of the sample mean

μ = the population value stated in $H_0 = 50$

$\sigma_{\bar{X}}$ = the standard error of a distribution of means of samples of 25

$$Z = \frac{\bar{X} - \mu}{\sigma_{\bar{X}}}$$

$$-1.96 = \frac{\bar{X}_c - 50}{2}$$

$$\bar{X}_c = 46.08$$

$$1.96 = \frac{\bar{X}_c - 50}{2}$$

$$\bar{X}_c = 53.92$$

Probability of Making A Type I Error

B

Factors Affecting Probability of Committing a β Error

True value of parameter

Alpha level selected

One or two-tailed test used

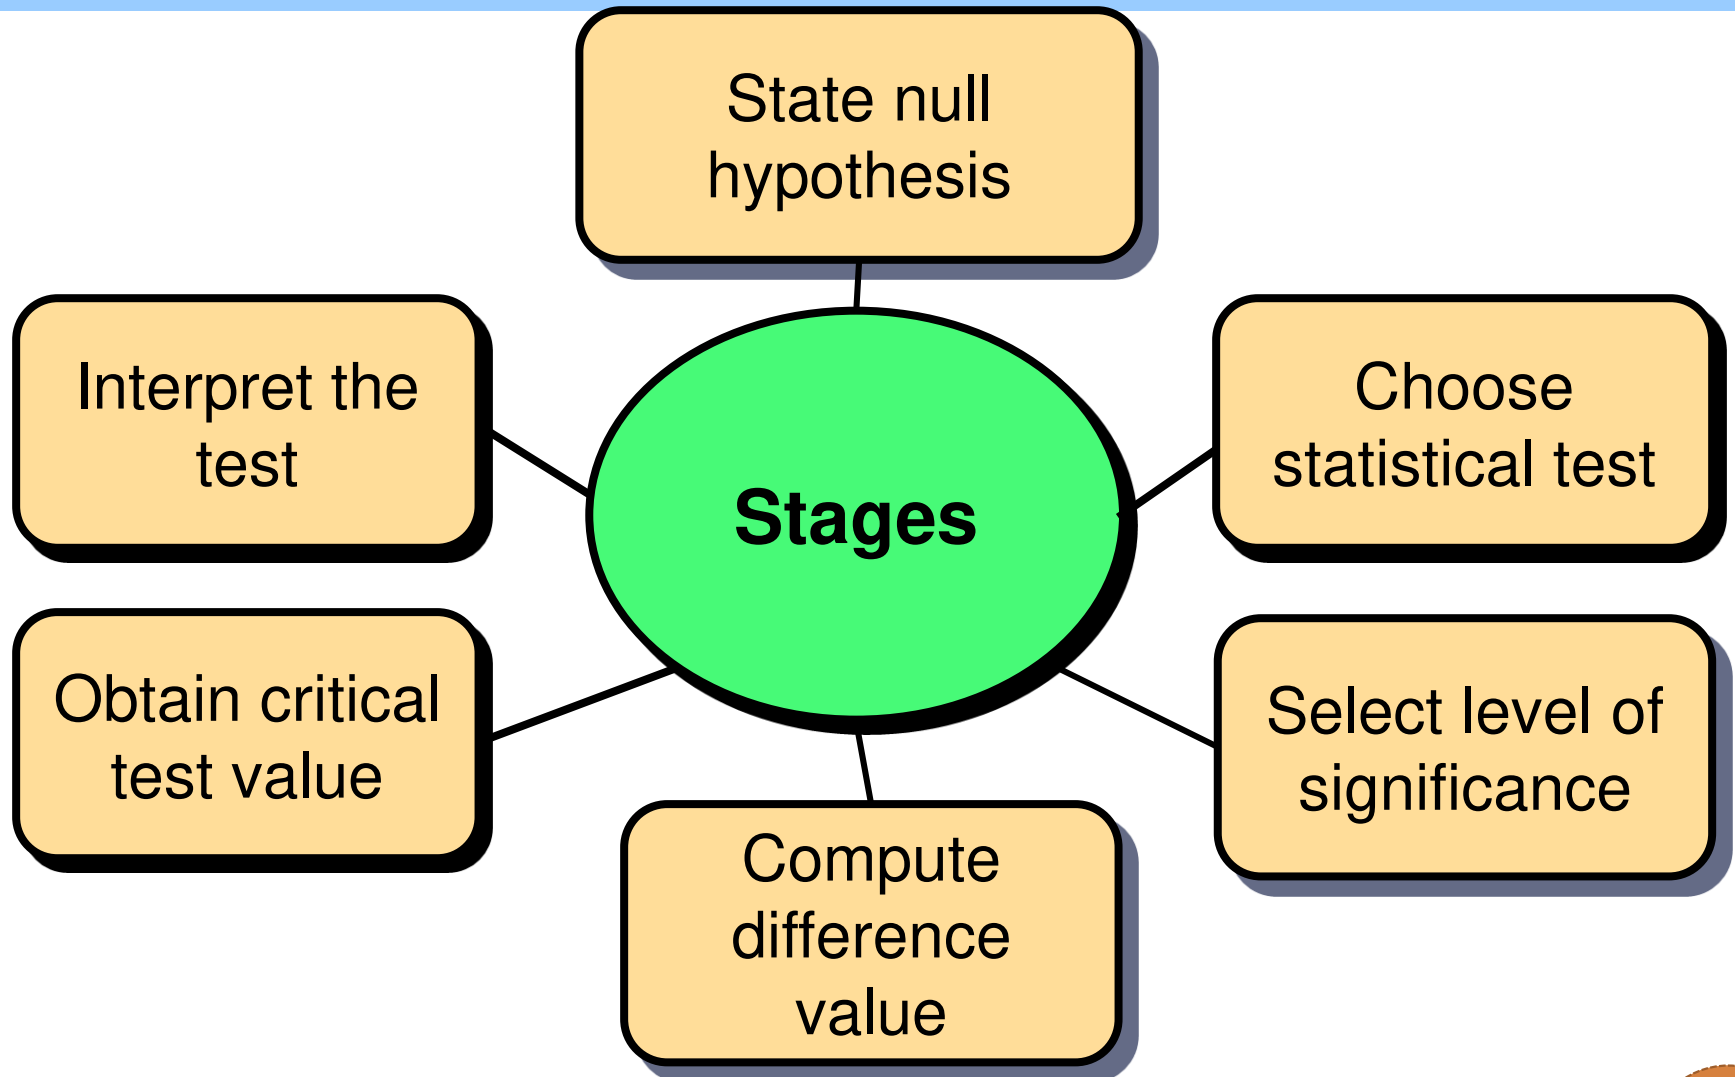

Sample standard deviation

Sample size

Probability of Making A Type II Error

Statistical Testing Procedures

Tests of Significance

Assumptions for Using Parametric Tests

Independent observations

Normal distribution

Equal variances

Interval or ratio scales

Probability Plot

Probability Plot

Probability Plot

Advantages of Nonparametric Tests

Easy to understand and use

Usable with nominal data

Appropriate for ordinal data

Appropriate for non-normal
population distributions

How to Select a Test

How many samples are involved?

If ≥ 2

Are the individual cases independent or related?

Is the measurement nominal, ordinal, interval, or ratio?

Recommended Statistical Techniques

Measurement Scale	One-Sample Case	Two-Sample Tests		k-Sample Tests	
		Related Samples	Independent Samples	Related Samples	Independent Samples
Nominal	<ul style="list-style-type: none"> Binomial χ^2 one-sample test 	<ul style="list-style-type: none"> McNemar 	<ul style="list-style-type: none"> Fisher exact test χ^2 two-samples test 	<ul style="list-style-type: none"> Cochran Q 	<ul style="list-style-type: none"> χ^2 for k samples
Ordinal	<ul style="list-style-type: none"> Kolmogorov-Smirnov one-sample test Runs test 	<ul style="list-style-type: none"> Sign test Wilcoxon matched-pairs test 	<ul style="list-style-type: none"> Median test Mann-Whitney U Kolmogorov-Smirnov Wald-Wolfowitz 	<ul style="list-style-type: none"> Friedman two-way ANOVA 	<ul style="list-style-type: none"> Median extension Kruskal-Wallis one-way ANOVA
Interval and Ratio	<ul style="list-style-type: none"> t-test Z test 	<ul style="list-style-type: none"> t-test for paired samples 	<ul style="list-style-type: none"> t-test Z test 	<ul style="list-style-type: none"> Repeated-measures ANOVA 	<ul style="list-style-type: none"> One-way ANOVA n-way ANOVA

Questions Answered by One-Sample Tests

Difference between observed and expected frequencies?

Difference between observed and expected proportions?

Significant difference between some measure of central tendency and the population parameter?

Parametric Tests

One-Sample *t*-Test Example

<i>Null</i>	<i>Ho: = 50 mpg</i>
<i>Statistical test</i>	<i>t-test</i>
<i>Significance level</i>	<i>.05, n=100</i>
<i>Calculated value</i>	<i>1.786</i>
<i>Critical test value</i>	<i>1.66</i> <i>(from Appendix C,</i> <i>Exhibit C-2)</i>

One Sample Chi-Square Test Example

<i>Living Arrangement</i>	<i>Intend to Join</i>	<i>Number Interviewed</i>	<i>Percent (no. interviewed/200)</i>	<i>Expected Frequencies (percent x 60)</i>
<i>Dorm/fraternity</i>	16	90	45	27
<i>Apartment/rooming house, nearby</i>	13	40	20	12
<i>Apartment/rooming house, distant</i>	16	40	20	12
<i>Live at home</i>	<u>15</u>	<u>30</u>	<u>15</u>	<u>9</u>
<i>Total</i>	60	200	100	60

One-Sample Chi-Square Example

<i>Null</i>	<i>$H_0: 0 = E$</i>
<i>Statistical test</i>	<i>One-sample chi-square</i>
<i>Significance level</i>	<i>.05</i>
<i>Calculated value</i>	<i>9.89</i>
<i>Critical test value</i>	<i>7.82</i> (from Appendix C, Exhibit C-3)

Two-Sample Parametric Tests

$$Z = \frac{(\bar{X}_1 - \bar{X}_2) - (\mu_1 - \mu_2)0}{\sqrt{\frac{S_1^2}{n_1} + \frac{S_2^2}{n_2}}}$$

$$t = \frac{(\bar{X}_1 - \bar{X}_2) - (\mu_1 - \mu_2)0}{\sqrt{S_p^2 \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}}$$

Two-Sample t-Test Example

	<i>A Group</i>	<i>B Group</i>
<i>Average hourly sales</i>	$X_1 =$ \$1,500	$X_2 =$ \$1,300
<i>Standard deviation</i>	$s_1 = 225$	$s_2 = 251$

Two-Sample t-Test Example

<i>Null</i>	<i>Ho: A sales = B sales</i>
<i>Statistical test</i>	<i>t-test</i>
<i>Significance level</i>	<i>.05 (one-tailed)</i>
<i>Calculated value</i>	<i>1.97, d.f. = 20</i>
<i>Critical test value</i>	<i>1.725</i> <i>(from Appendix C, Exhibit C-2)</i>

Two-Sample Nonparametric Tests: Chi-Square

		<i>On-the-Job-Accident</i>		
	<i>Cell Designation Count Expected Values</i>	<i>Yes</i>	<i>No</i>	<i>Row Total</i>
Smoker	<i>Heavy Smoker</i>	1,1 12, 8.24	1,2 4 7.75	16
	<i>Moderate</i>	2,1 9 7.73	2,2 6 7.27	15
	<i>Nonsmoker</i>	3,1 13 18.03	3,2 22 16.97	35
	<i>Column Total</i>	34	32	66

Two-Sample Chi-Square Example

<i>Null</i>	<i>There is no difference in distribution channel for age categories.</i>
<i>Statistical test</i>	<i>Chi-square</i>
<i>Significance level</i>	<i>.05</i>
<i>Calculated value</i>	<i>6.86, d.f. = 2</i>
<i>Critical test value</i>	<i>5.99</i> <i>(from Appendix C, Exhibit C-3)</i>

SPSS Cross-Tabulation Procedure

INCOME BY POSSESSION OF MBA

Count	MBA		Row Total
	Yes 1	No 2	
INCOME			
High 1	30	30	60 60.0
Low 2	10	30	40 40.0
Column Total	40 40.0	60 60.0	100 100.0

Chi-Square	Value	D.F.	Significance
Pearson	6.25000	1	.01242
Continuity Correction	5.25174	1	.02192
Likelihood Ratio	6.43786	1	.01117
Mantel-Haenszel	6.18750	1	.01287
Minimum Expected Frequency: 16.000			

Two-Related-Samples Tests

Sales Data for Paired-Samples t-Test

Company	Sales Year 2	Sales Year 1	Difference D	D ²
GM	126932	123505	3427	11744329
GE	54574	49662	4912	24127744
Exxon	86656	78944	7712	59474944
IBM	62710	59512	3192	10227204
Ford	96146	92300	3846	14971716
AT&T	36112	35173	939	881721
Mobil	50220	48111	2109	4447881
DuPont	35099	32427	2632	6927424
Sears	53794	49975	3819	14584761
Amoco	23966	20779	3187	10156969
Total			$\Sigma D = 35781$	$\Sigma D^2 = 157364693$

Paired-Samples t-Test Example

<i>Null</i>	<i>Year 1 sales = Year 2 sales</i>
<i>Statistical test</i>	<i>Paired sample t-test</i>
<i>Significance level</i>	<i>.01</i>
<i>Calculated value</i>	<i>6.28, d.f. = 9</i>
<i>Critical test value</i>	<i>3.25</i> <i>(from Appendix C, Exhibit C-2)</i>

SPSS Output for Paired-Samples *t*-Test

---*t*-tests for paired samples---

Variable	Number of Cases	Mean	Standard Deviation	Standard Error
Year 2 Sales	10	62620.9	31777.649	10048.975
Year 1 Sales	10	59038.8	31072.871	9836.104

(Difference Mean)	Standard Deviation	Standard Error	Corr.	2-tail Prob.	<i>t</i> Value	Degrees of Freedom	2-tail Prob.
3582.1000	1803.159	570.209	.999	.000	6.28	9	.000

Related Samples Nonparametric Tests: McNemar Test

<i>Before</i>	<i>After Do Not Favor</i>	<i>After Favor</i>
<i>Favor</i>	<i>A</i>	<i>B</i>
<i>Do Not Favor</i>	<i>C</i>	<i>D</i>

Related Samples Nonparametric Tests: McNemar Test

<i>Before</i>	<i>After Do Not Favor</i>	<i>After Favor</i>
<i>Favor</i>	<i>A=10</i>	<i>B=90</i>
<i>Do Not Favor</i>	<i>C=60</i>	<i>D=40</i>

k-Independent-Samples Tests: ANOVA

Tests the null hypothesis that the means of three or more populations are equal.

One-way: Uses a single-factor, fixed-effects model to compare the effects of a treatment or factor on a continuous dependent variable.

ANOVA Example

<i>Model Summary</i>					
<i>Source</i>	<i>d.f.</i>	<i>Sum of Squares</i>	<i>Mean Square</i>	<i>F Value</i>	<i>p Value</i>
<i>Model (airline)</i>	<i>2</i>	<i>11644.033</i>	<i>5822.017</i>	<i>28.304</i>	<i>0.0001</i>
<i>Residual (error)</i>	<i>57</i>	<i>11724.550</i>	<i>205.694</i>		
<i>Total</i>	<i>59</i>	<i>23368.583</i>			

<i>Means Table</i>				
	<i>Count</i>	<i>Mean</i>	<i>Std. Dev.</i>	<i>Std. Error</i>
<i>Lufthansa</i>	<i>20</i>	<i>38.950</i>	<i>14.006</i>	<i>3.132</i>
<i>Malaysia Airlines</i>	<i>20</i>	<i>58.900</i>	<i>15.089</i>	<i>3.374</i>
<i>Cathay Pacific</i>	<i>20</i>	<i>72.900</i>	<i>13.902</i>	<i>3.108</i>

All data are hypothetical

ANOVA Example Continued

<i>Null</i>	$\mu A1 = \mu A2 = \mu A3$
<i>Statistical test</i>	<i>ANOVA and F ratio</i>
<i>Significance level</i>	<i>.05</i>
<i>Calculated value</i>	<i>28.304, d.f. = 2, 57</i>
<i>Critical test value</i>	<i>3.16</i> <i>(from Appendix C, Exhibit C-9)</i>

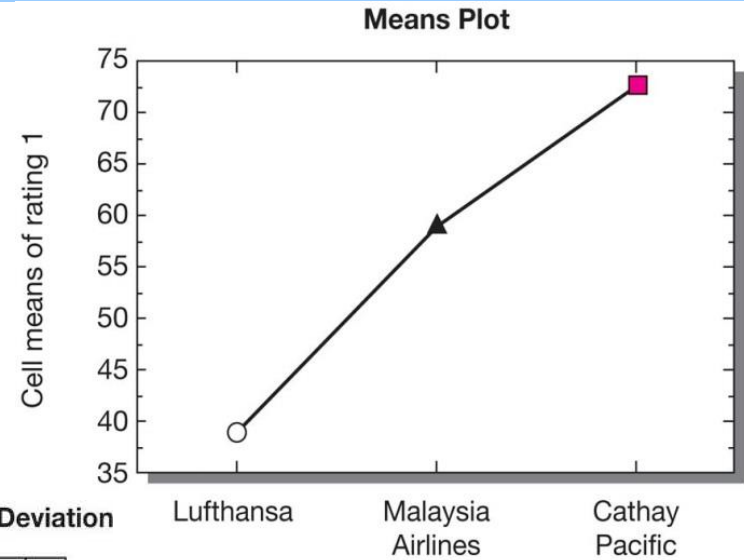

Post Hoc: Scheffe's S Multiple Comparison Procedure

	<i>Verses</i>	<i>Diff</i>	<i>Crit. Diff.</i>	<i>p Value</i>
<i>Lufthansa</i>	<i>Malaysia Airlines</i>	<i>19,950</i>	<i>11.400</i>	<i>.0002</i>
	<i>Cathay Pacific</i>	<i>33.950</i>	<i>11.400</i>	<i>.0001</i>
<i>Malaysia Airlines</i>	<i>Cathay Pacific</i>	<i>14.000</i>	<i>11.400</i>	<i>.0122</i>

Multiple Comparison Procedures

<i>Test</i>	<i>Complex Comparisons</i>	<i>Pairwise Comparisons</i>	<i>Equal n's Only</i>	<i>Unequal n's</i>	<i>Equal Variances Assumed</i>	<i>Unequal Variances Not Assumed</i>
<i>Fisher LSD</i>	X			X	X	
<i>Bonferroni</i>	X		X	X		
<i>Tukey HSD</i>	X		X		X	
<i>Tukey-Kramer</i>	X			X	X	
<i>Games-Howell</i>	X			X		X
<i>Tamhane T2</i>	X			X		X
<i>Scheffé S</i>		X	X	X	X	
<i>Brown-Forsythe</i>		X	X	X		X
<i>Newman-Keuls</i>	X				X	
<i>Duncan</i>	X				X	
<i>Dunnet's T3</i>						X
<i>Dunnet's C</i>						X

ANOVA Plots

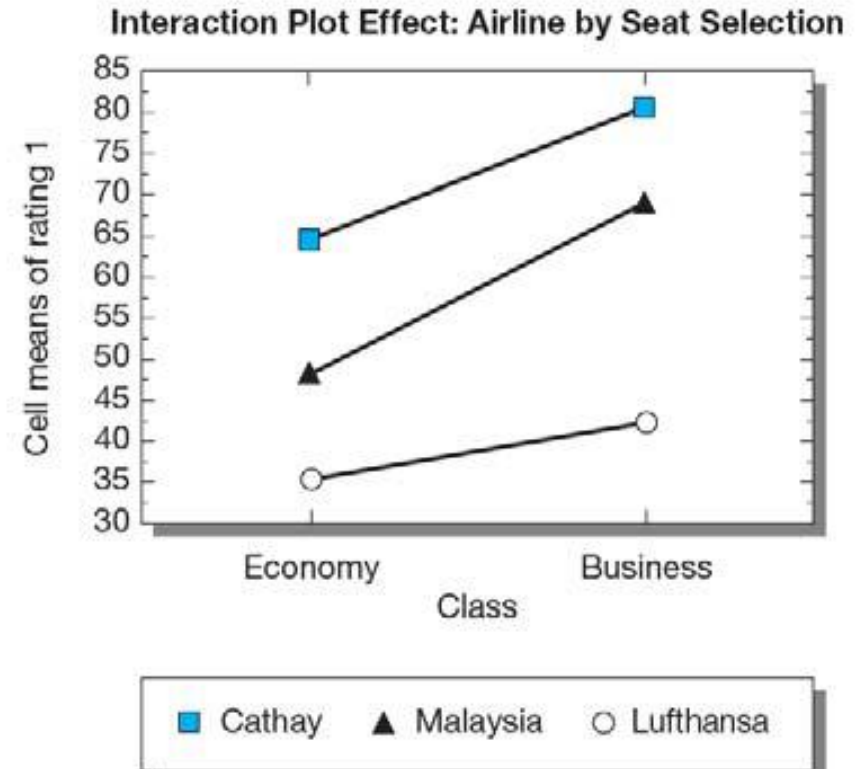

Two-Way ANOVA Example

All data are hypothetical

Model Summary					
Source	d.f.	Sum of Squares	Mean Square	F Value	p Value
Airline	2	11644.033	5822.017	39.178	0.0001
Seat selection	1	3182.817	3182.817	21.418	0.0001
Airline by seat selection	2	517.033	258.517	1.740	0.1853
Residual	54	8024.700	148.606		

Means Table Effect: Airline by Seat Selection				
	Count	Mean	Std. Dev.	Std. Error
Lufthansa economy	10	35.600	12.140	3.839
Lufthansa business	10	42.300	15.550	4.917
Malaysia Airlines economy	10	48.500	12.501	3.953
Malaysia Airlines business	10	69.300	9.166	2.898
